PEG Procedure Report

Patient: Ms. Marion Karron
Patient ID: 001687409
Exam Date: 09/11/2008

Attending Physician: Jeffrey Kalman M.D.
Referring Physician:

720-5928

INTRODUCTION:

78 year old female patient presents for an elective outpatient EGD. The indication for the procedure was peg placement.

CLINICAL HISTORY & PHYSICAL EXAMINATION:

The patient's clinical history and physical examination were performed and are documented in the patient's record.

CONSENT:

The benefits, risks, and alternatives to the procedure were discussed and informed consent was obtained from the patient.

PREPARATION:

EKG, pulse, pulse oximetry and blood pressure monitored.

PROCEDURE:

The endoscope was passed with ease under direct visualization to the esophagus.

FINDINGS:

HYPOPHARYNX: The hypopharynx appeared normal.

ESOPHAGUS: The esophagus appeared normal.

GE-JUNCTION: At 40 cm from the gums,

STOMACH: There was evidence of nonerosive gastritis of the stomach.

PYLORUS: The pylorus appeared normal.

DUODENUM: The duodenum appeared normal.

THERAPY: Percutaneous endoscopic gastrostomy: In a darkened room, the abdominal wall was transilluminated and the puncture site was chosen. Indentation of the gastric wall by external finger pressure was demonstrated. The skin was surgically prepared and anesthetized with xylocaine. A small incision was made with a surgical blade and a 25 gauge needle with cannula was inserted through the abdominal wall. A guide wire was passed through the cannula, was caught by the snare passed through the endoscope and brought out through the mouth. A Corflo 20 Fr PEG tube was secured to the guide wire and pulled through the abdominal wall. The gastrostomy tube was secured with the outer flange positioned at 3 cm. There were no complications, and the patient tolerated the procedure well.

IMPRESSION:

1. Nonerosive gastritis of the stomach. [535.40].

RECOMMENDATION:

- Do not use the gastrostomy tube for 24 hours.
- Do not clamp the feeding tube, cap it.
- NPO for 24 hours.
- Continue current IV fluids.
- G-tube to gravity drainage.
- Change G-tube dressing daily.
- After 24 hours, begin sterile water at 50 cc's per hour via G-tube for 4 hours.
- If no pain, fever, complications from patient, begin tube feeding per recommendations of attending physician.
- If any questions arise regarding PEG tube, notify me.

Chemistry

Glucose H 173 65-99 mg/dL

Criteria for the diagnosis of diabetes:
 (Fasting Glucose)

<100 mg/dL: Normal fasting glucose
 100-125 mg/dL: Impaired fasting glucose
 >125 mg/dL: Indicative of diabetes
 Ref: Diabetes Care 29:S43-S48, 2006

Urea Nitrogen H 68 9-23 mg/dL

Creatinine 0.6 0.6-1.1 mg/dL

BUN/Creat Ratio H 112.6 5.0-30.0

Sodium H 149 132-146 mEq/L

Sodium levels may be elevated due to a variety of preanalytical factors. Diagnose in light of clinical observations, other tests and patient history

Potassium 5.1 3.5-5.5 mEq/L

Chloride 109 99-109 mEq/L
